

# Spark Hands-On

Mai H. Nguyen, Ph.D.

# **PySpark Scaling Hands-On**

#### Data

- BookReviews\_5M.txt
  - Source : <a href="https://jmcauley.ucsd.edu/data/amazon/">https://jmcauley.ucsd.edu/data/amazon/</a>

#### Notebook

- pyspark\_demo.ipynb
- To do
  - Change number of cores: 1, 2, 4
  - Note difference in execution times

## **GETTING EXECUTION TIMES**

- In notebook, execution time is printed out in cell before Spark session is stopped (next to last cell)
- Need to <u>restart the kernel</u> and run all cells without stopping to get accurate execution time:
  - Run -> Restart Kernel and Run All Cells
- Find mean and standard deviation of execution times over 3 runs for
  - 1 core, 2 cores, and 4 cores

## SPARK SESSION

```
available cores, or
                                                       integer value to
import pyspark
                                                       specify number of
from pyspark.sql import SparkSession, SparkConf
                                                       cores to use
conf = SparkConf().setAll([
           ('spark.master', 'local[*]'),
           ('spark.app.name', 'PySpark Demo')])
spark = SparkSession.builder.config(conf=conf).getOrCreate()
                          Configuration
                                                   Get existing Spark
                          parameters for
                                                   session or create
                          Spark session
                                                   new one
```

Use \* to use all

## SPARK PROGRAM STRUCTURE

## Start Spark session

- spark = SparkSession.builder.config(conf=conf).getOrCreate()
- Create distributed dataset
  - df = spark.read.csv("data.csv",header="True")
- Apply transformations
  - new\_df = df.filter(col("dept") == "Sales")
- Perform actions
  - df.collect()
- Stop Spark session
  - spark.stop()

## START SPARK SESSION

```
available cores, or
                                                       integer value to
import pyspark
                                                       specify number of
from pyspark.sql import SparkSession, SparkConf
                                                       cores to use
conf = SparkConf().setAll([
           ('spark.master', 'local[*]'),
           ('spark.app.name', 'PySpark Demo')])
spark = SparkSession.builder.config(conf=conf).getOrCreate()
                          Configuration
                                                   Get existing Spark
                          parameters for
                                                   session or create
                          Spark session
                                                   new one
```

Use \* to use all

## LOAD DATA

## **DROP ROWS WITH NULLS**

Drop rows with null values

```
df.dropna()
df.dropna(how='any')
df.dropna(how='all')
```

Check number of rows before and after dropping rows

```
df.count()
```

## CREATE FEATURE VECTOR COLUMN

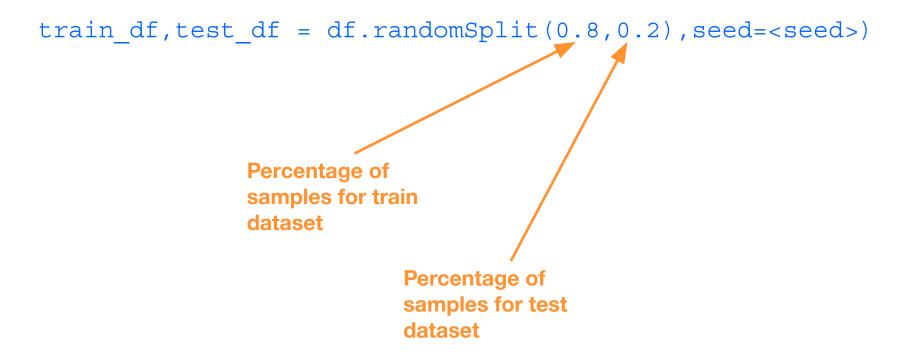

- Create feature vector column
  - Combines given list of columns into single vector column
  - To feed data to machine learning models

```
from pyspark.ml.feature import VectorAssembler
features = ['air_temp','relative humidity']
assembler = VectorAssembler(inputCols=features,
                              outputCol='featureVector')
features df = assembler.transform(df)
features df.show()
                                                 New column
air temp|relative humidity
                                                 appended to
                                                 features df
          63.9
62.96
air temp|relative_humidity|featureVector
                           [62.96, 63.9]
          63.9
62.96
```

## PARTITION DATA

Partition available data into train and test data sets

## **SCALE DATA**

## Scale input data values

- Standardize values to have zero mean and unit standard deviation
- Each feature is scaled separately
- Create scale transformer using train data, then apply to train/test data

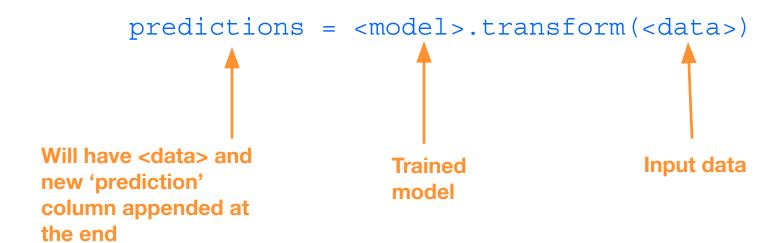

## **BUILD MODEL**

- Build decision tree classifier
  - Create model
  - Use fit() to train model

## **APPLY MODEL**

- Apply trained model
  - Use transform()

## **EVALUATE CLASSIFICATION MODEL**

- Evaluator for classification model
  - Calculates F1, precision, recall, accuracy

# PySpark Cluster Analysis Hands-On

#### Data

Weather station measurements

#### Task

Perform cluster analysis to identify different weather patterns

## Approach

Spark k-means

#### Notebook

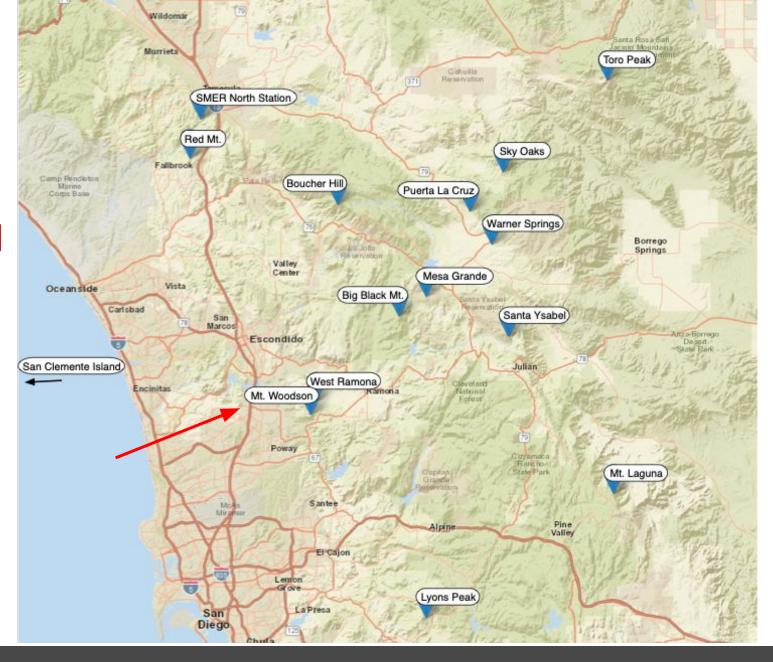

pyspark-clustering.ipynb

## **Dataset Description**

- Measurements from weather station on Mt. Woodson, San Diego
- Air temperature, humidity, wind speed, wind direction, etc.
- Three years of data: Sep. 2011 Sep. 2014
  - minute\_weather.csv: measurement every minute
- Source
  - http://hpwren.ucsd.edu

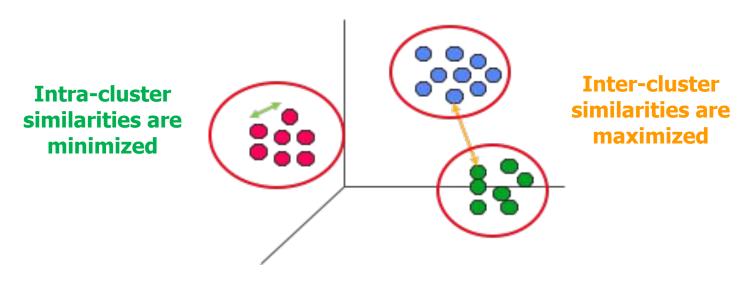

# Map of HPWREN Weather Stations

## **Cluster Analysis**

- Cluster analysis divides data into groups
  - · Grouping is based on some similarity measure.
  - Samples within a cluster are more similar to each other than to samples in other clusters.

http://www-users.cs.umn.edu/~kumar/dmbook/index.php

# k-Means Clustering

### Partitional

Clusters are divided into non-overlapping subsets

#### Centroid-Based

Cluster represented by central vector

## Simple, classic clustering technique

- Data points are grouped into k clusters
- Cluster defined by cluster mean

## Algorithm

Select *k* initial *centroids* (cluster centers)

Repeat

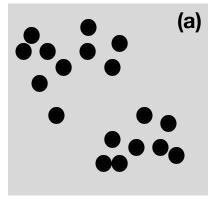

Assign each sample to closest centroid Calculate mean of cluster to determine new centroid

centroid

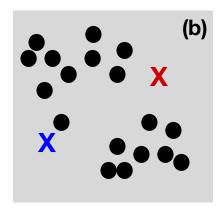

Until some stopping criterion is reached

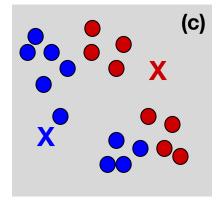

## k-Means Clustering Illustration

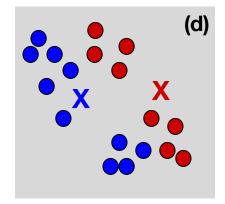

Original samples

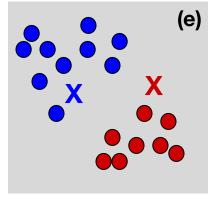

**Initial Centroids** 

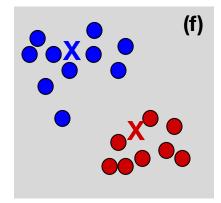

Assign Samples

Re-calculate Centroids

Assign Samples

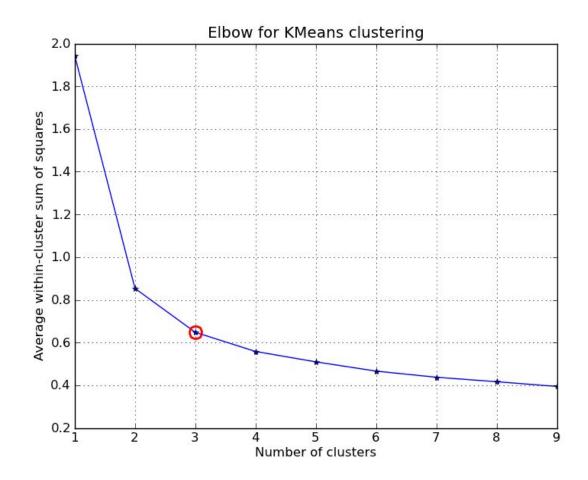

Re-calculate Centroids

# Choosing Number of Clusters (k)

#### Elbow method

- Plot cluster evaluation metric (e.g., WSSE) vs. different values for k
- "Elbow" in plot suggests value(s) for k

http://stackoverflow.com/questions/6645895/calculating-the-percentage-of-variance-measure-for-k-means

# **Evaluating Clustering Results**

- Within-Cluster Sum of Squared Error (WSSE)
- For each sample, error is distance to centroid.
   Then, WSSE is computed as:

$$WSSE = \sum_{i=1}^{K} \sum_{x \in C_i} ||x - m_i||^2$$

x: data sample in cluster  $C_i$   $m_i$ : cluster centroid (i.e., mean of cluster)  $||x - m_i||^2$ : Euclidean distance between  $m_i$  and x

## Clustering Hands-On Overview

## Setup

- Start Spark
- Load modules

#### Load data

- Specify schema
- Read in data from "minute\_weather.csv"

## Explore data

Look at schema, number of rows, summary statistics

## Prepare data

- Drop nulls
- Create feature vector

## Perform k-means cluster analysis

- Use elbow plot to determine k
- Build k-means model

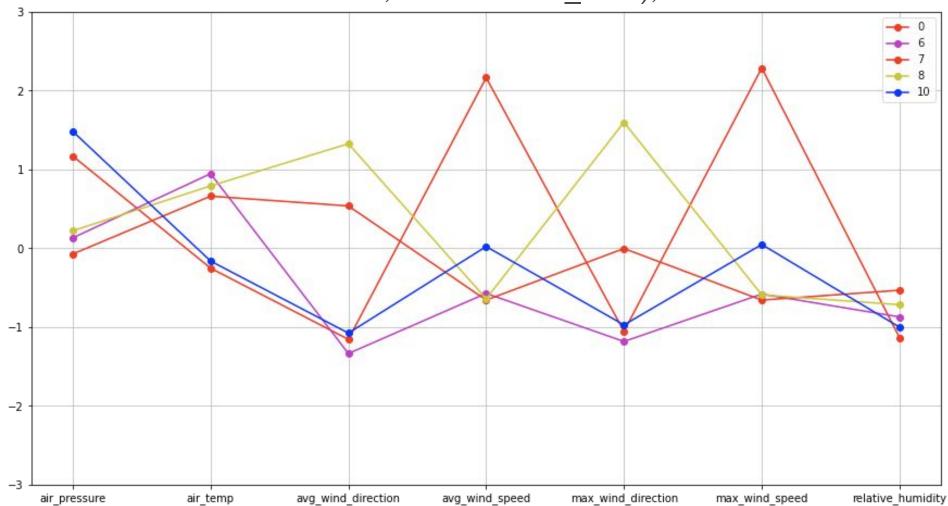

#### Evaluate clusters

- Plot cluster profiles
- Stop Spark session

## **Cluster Profile: Parallel Plots**

utils.parallel\_plot(centersNamed[centersNamed['relative\_humidity'] < -0.5], numClusters, colors=colors\_used);

## Setup

- Login to Expanse
  - Open terminal window on local machine
  - ssh login.expanse.sdsc.edu -l <xdtr\_account>
- Pull latest from repo
  - git pull
  - · URL:

https://github.com/ciml-org/ciml-summer-institute-2022

## **Server Setup for PySpark - Command Line**

#### In terminal window

- jupyter\_shared\_spark
  - Alias for: galyleo launch --account \${CIML\_ACCOUNT} --reservation \${CIML\_RESERVATION\_CPU} --partition shared --cpus 4 --memory 16 --time-limit 04:00:00 --env-modules singularitypro --sif /cm/shared/apps/containers/singularity/ciml/2022/pyspark-latest.sif --bind /expanse,/scratch,/cm --quiet
- To check queue
  - squeue -u \$USER

## **Data Setup**

- In terminal window in Jupyter Lab, do the following
- Go to your home directory
- Link to data directory
   In -s /cm/shared/examples/sdsc/ciml/2022 data
- Check contents of data directory

```
Is data
Should see
```

# PySpark Cluster Analysis Hands-On

#### Code

- pyspark-clustering.ipynb
  - Notebook for hands-on
  - Add your code where indicated
    - # ==> YOUR CODE HERE
- pyspark-clustering-wOutput.ipynb
  - Has cell outputs
- utils.py
  - Has utility functions

## Resources

- Apache Spark
- PySpark Documentation PySpark Documentation
- Spark SQL and DataFrames Guide
- Python for Data Science Cheat Sheet (pdf)

## **SparkR**

- R package that provides frontend to use Spark from R
- Supports distributed machine learning using R API
- Allows R script to connect to Spark cluster
- Can use with R shell or RStudio or other R IDEs.

## **SparkR**

- Uses MLlib for machine learning functionality
- Familiar R syntax:
  - Read contents of file into a Spark dataframe
    - newdata <- read.df ("data.txt", source="csv")</li>
  - R formula operators for model fitting:
    - model <- spark.randomForest(training, label ~ features, "classification", numTrees = 10)
  - Get summary of fitted model
    - summary(model)
  - Apply model to make predictions
    - predictions <- predict(model, testDF)</li>
  - Save model
    - write.ml (model, "mymodel")

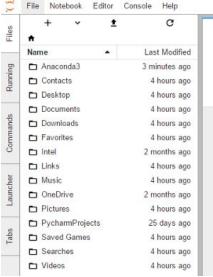

## Running SparkR Code

File Edit Code View Plots Session Build Debug Tools Help

\_ D X

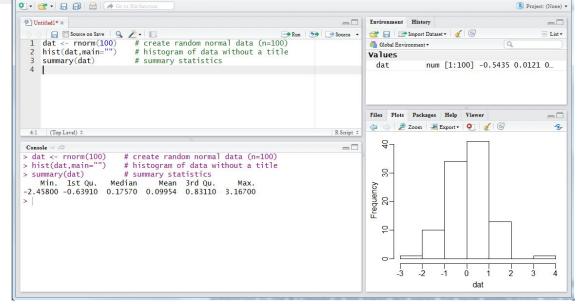

RStudio

## sparklyr

- R interface for Spark
- R Legacy
  - From Rstudio
  - Available on CRAN
- Spark backend to dplyr and SQL
  - Interactively manipulate Spark data using dplyr and SQL
- Access to Spark functionality
  - Interface to Spark MLlib algorithms
- Connect to Spark clusters

## sparklyr

## Setup

- install.packages("sparklyr")
- library(sparklyr)
- spark\_install ()

## Connect to Spark

sc <- spark\_connect (master="local")</li>

## Using dplyr

```
flights_sdf %>% group_by(tailnum)%>% filter(count > 20)
```

## Machine Learning

```
    model <- ml_random_forest (
train_sdf, quality ~ ., type="classification")
```

## sparklyr Functions

## Spark Operations

Manage Spark connections (e.g., spark\_config())

## Spark Data Manipulation

 Read data in Spark DataFrame and perform operations (e.g., spark\_read\_csv(), tbl\_cache())

#### Feature Transformers

Transform data (e.g., ml\_pca(), ft\_bucketizer())

## Distributed Machine Learning

Access Spark Mllib algorithms (e.g., ml\_kmeans())

## Streaming

Support streaming data operations (e.g., stream\_read\_json())

#### Extensions

Interface to platforms for big data analysis, graph analytics, production

# Machine Learning Algorithms in SparkR

#### **Machine Learning**

#### **Algorithms**

SparkR supports the following machine learning algorithms currently:

#### Classification

- spark.logit:Logistic Regression
- spark.mlp: Multilayer Perceptron (MLP)
- spark.naiveBayes: Naive Bayes
- spark.svmLinear: Linear Support Vector Machine

#### Regression

- spark.survreg: Accelerated Failure Time (AFT) Survival Model
- spark.glm or glm: Generalized Linear Model (GLM)
- spark.isoreg: Isotonic Regression

#### Tree

- spark.gbt: Gradient Boosted Trees for Regression and Classification
- spark.randomForest: Random Forest for Regression and Classification

#### Clustering

- spark.bisectingKmeans: Bisecting k-means
- spark.gaussianMixture: Gaussian Mixture Model (GMM)
- spark.kmeans: K-Means
- spark.lda: Latent Dirichlet Allocation (LDA)

#### Collaborative Filtering

spark.als: Alternating Least Squares (ALS)

#### Frequent Pattern Mining

spark.fpGrowth:FP-growth

#### **Statistics**

spark.kstest:Kolmogorov-Smirnov Test
